

Opasraportti

FSci -Master's programme in Mathematical Sciences (2020 - 2021)

University's new study guide for academic year 2020-2021 is published at <https://opas.peppi oulu.fi>.

The study guide includes information on degrees, curriculums, courses and course timetables. Course registrations are still done in Oodi.

If you have questions on information in the study guide, please contact the study field's Academic Affairs Service Team <https://www oulu.fi/forstudents/faculty-study-affairs>.

Tutkintorakenteet

Master's degree (Mathematical Sciences)

Tutkintorakenteen tila: published

Lukuvuosi: 2020-21

Lukuvuoden alkamispäivämäärä: 01.08.2020

Studies of the line of speciallization (vähintään 60 op)

Mathematics orientation

H325053: Mathematics advanced module, 0 - 100 op

802656S: Algebraic numbers, 5 op

Voimassaolo: 01.01.2012 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish and English

Timing:

3/4 year, 4th period

Learning outcomes:

As usual in my mathematical studies I shall be able to solve problems arising from the subject and to prove essential theorems starting from the given definitions using the tools applied in the course. More detailed; For example, when I pass the course with the grade 1/5, I shall recognize most definitions and I am able to solve closely related problems. Also I am able to rewrite short proofs with some understanding. When I pass the course with the grade 5/5, then I shall understand well the given definitions with the proofs of the theorems deduced from them. Further, I am able to solve challenging problems which demand independent deductions with several stages and applications of appropriate tools.

Contents:

First we revise some basics of rings and fields which are needed to proceed ahead field extensions. In particular, divisibility in an integral domain is carefully studied yielding to applications in the theory of polynomial algebra and algebraic integers. The theory of algebraic numbers is strongly based on polynomial algebra, where the properties of zeros and divisibility of polynomials are considered. The definition of an algebraic number will be generalized to the algebraic elements of field extensions going forward to algebraic fields. Considered as most important algebraic fields we get number fields which are finitely generated subfields of the field A of all complex algebraic numbers. In particular, we study quadratic number fields. Further, we shall consider the divisibility and factorization of algebraic integers with some applications to Diophantine equations.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors

Prerequisites and co-requisites:

Basics in Algebra, Algebraic structures, Matrix algebra, Linear algebra, Basics in Number Theory

Recommended or required reading:

I.N. Stewart and D.O. Tall: Algebraic number theory, Mollin, Richard A., Advanced number theory with applications,

Course material: <http://cc.oulu.fi/~tma/OPETUS.html>

Grading:

1-5, fail

Voimassaolo: 01.06.2014 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: English

ECTS Credits:

10 ECTS credits

Language of instruction:

English or Finnish

Timing:

4th or 5th year

Learning outcomes:

After completing the course successfully, students know the basic concepts of differential geometry and masters differential calculus on manifolds.

Contents:

Manifolds, vector fields, tensor fields and differential forms.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 56 h and exercises 28 h

Target group:

Major students in mathematics and physics

Prerequisites and co-requisites:

Bachelor's degree in mathematics or equivalent

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Lectures. Recommended reading is given on the first lecture.

Assessment methods and criteria:

Final exam or written work and talk.

Grading:

1-5 or pass/fail

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

4th or 5th year of studies

Learning outcomes:

On successful completion of this course, the student will be able to identify the correct methods for solving the linear optimization problems and implement the most typical numerical algorithms for solving linear optimization problems.

Contents:

The lecture course is focused to methods, which can apply for solving essential linear optimization problems of technical and economical sciences. The lectures consist of following topics: Convex sets, Graphical solution of LP problem, dual formulation, simplex algorithm, dual-simplex algorithm. The topics are considered theoretically and also numerical algorithms for problem solution are presented.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h and exercises 14 h

Target group:

Pää- ja sivuaineopiskelijat

Prerequisites and co-requisites:

Bachelor degree in mathematics or equivalent

Arvostelu: 1 - 5, pass, fail

Opettajat: Esa Järvenpää

Opintokohteen kielet: Finnish

ECTS Credits:

10 ECTS credits

Learning outcomes:

After passing the course the student:

- is able to use the central methods in fractal geometry
- can determine different dimensions
- knows the basic properties of dimensions

Contents:

Fractals are irregular sets having varying structure at all scales. Fractal geometry is a branch of mathematics where geometric properties of fractals are studied. Fractals are used in various fields of mathematics as well as in applications. The course concentrates on basic tools of fractal geometry including different concepts of dimension.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

56 h lectures, 28 h exercises, 182 h independent study

Target group:

Mathematics majors

Prerequisites and co-requisites:

Leikkaavuudet:

800624S Analysis III 10.0 op

ECTS Credits:

5 ECTS credits

Learning outcomes:

After completing the course, the student is able to define Banach and Hilbert spaces, give examples of these and prove basic results about these spaces.

Contents:

The course is an introduction to Banach and Hilbert spaces. The notion of complete norm plays a central role in the course. For Hilbert spaces, orthonormal basis and orthogonal projections are studied. An important class of examples is given by sequence spaces and L^p -spaces.

Mode of delivery:

face-to-face teaching

Learning activities and teaching methods:

28 h lecture, 14 h exercises, 93 h self-study

10 ECTS credits

Language of instruction:

English

Timing:

First and second period.

Learning outcomes:

On successful completion of this course, the student will be able to:

- solve linear and quasi-linear partial differential equations of first order using the method of characteristics
- apply the method of separation of variables to solve initial-boundary value problems for heat, wave and Laplace equations
- verify that a given function is a fundamental solution of a partial differential operator
- use single and double layer potentials to solve boundary value problems for Laplacian

Contents:

Linear and nonlinear equations of the first order, trigonometric Fourier series, Laplace equation in \mathbb{R}^n and in bounded domains, potential theory, Green's function, Heat equation in \mathbb{R}^n and in bounded domains, Wave equation in \mathbb{R}^n and in bounded domains, d'Alembert formula for any dimensions, Fourier method.

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish/English

Timing:

1. period

Learning outcomes:

We start our lectures by considering b-base expansions and simple continued fraction expansions of real numbers. The properties of these expansions like -terminating, non-terminating, irrationality, periodicity, approximation properties will be studied.

Next we investigate general continued fractions with corresponding recurrences and transformations. A particular attention is paid for convergence and irrationality criteria.

Further, expansions of hypergeometric series are presented which imply expansions to well-known Napier's constant and π .

The research will be directed to more general irrationality questions and Diophantine equations, too.

5 ECTS credits

Language of instruction:

Finnish (in exercises also English)

Learning outcomes:

After passing the course the student is able to use:

- primality testing
- algorithms for solving discrete logarithm
- elliptic curves on cryptography
- lattices on cryptography
- digital signatures

Contents:

Primality testing, Pollard's $p-1$ factorization method, Shanks's Babystep-Giantstep algorithm, The index calculus method for computing discrete logarithms, Pollard rho method, The Pohlig-Hellman algorithm, Elliptic curves and cryptography (Diffie-Hellman, ElGamal, Menezes-Vanstone, Lenstra), Lattices and cryptography (GGH, NTRU, LLL), Digital signatures.

Language of instruction:

Finnish/English

Timing:

4th or 5th year of studies

Learning outcomes:

On successful completion of this course, the student will be able to choose proper numerical methods for solving basic mathematical problems and approximate the errors of numerical results.

Contents:

The lecture course is focused to numerical methods for solving the most common basic problems in mathematics. For the methods, convergence, stability and suitability for computer arithmetic are considered. The course contains numerical solution methods for the following basic problems: systems of nonlinear equations, systems of linear equations, interpolation, integration, derivation and differential equations.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h and exercises 14 h

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Valeriy Serov

Opintokohteen kielet: English

ECTS Credits:

10 ECTS credits

Language of instruction:

English

Timing:

The course is held in the whole autumn semester 2014/2015, during periods I and II. It is recommended to complete the course at the end of autumn semester.

Learning outcomes:

Upon completion the student should be able to:

- Operate with self-adjoint operators in the Hilbert spaces.
- Operate with compact operators in the Hilbert spaces.
- Operator with one-dimensional integral equations of the first and second order.

Contents:

1. Inner product spaces and Hilbert spaces.
2. Symmetric operators in the Hilbert space. J. von Neumann's theorems about symmetric operators. Basic criterion of self-adjointness.
3. Orthogonal projection operators. J. von Neumann's spectral theorem.
4. Spectrum of self-adjoint operator.
5. Riesz theory of compact operators.
6. Quadratic forms. Friedrichs extension of symmetric operators.
7. Elliptic differential operators in bounded domains.
8. Spectral function of self - adjoint operators. Green's function.
9. Integral operators with weak singularities. Integral equations of the first and second kind.
10. Volterra integral equations.
11. Singular integral equations.
12. Nyström's method for equation of second kind.
13. The Galerkin method for integral equations.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 56 h / Group work 24 h / Self-study 24 h. The exercises are completed as group work. (N.B. This must show all the course hours, which means that total 104 hours = 10 ECTS credits).

Target group:

Major students in mathematics, physics and engineering.

Prerequisites and co-requisites:

The required (or recommended) prerequisite is the completion of the following courses prior to enrolling for the course: Linear Algebra, Ordinary differential equations (I), Complex analysis (I), Analysis (I) and (II).

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

The following books are recommended (the course based on these books):

- 1) R. Kress, Linear integral equations, Springer-Verlag New York, 1999.
- 2) F. Riesz and B. Sz-Nagy, Functional analysis, Ungar, 1978.
- 3) A.N. Kolmogorov and S.V. Fomin, Elements of the theory of functions and functional analysis, Dover Publications, 1999.

Assessment methods and criteria:

The assessment criteria are based on the learning outcomes of the course. The final exam is required only.

Grading:

The course utilizes a numerical grading scale 1-5. In the numerical scale zero stands for a fail.

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

3rd or 4th year of studies

Learning outcomes:

After successful completion of the course the student can define the basic concepts and theorems of uni- and multidimensional discrete and continuous probability distributions and can apply this knowledge in other studies in statistics or applied mathematics. After successful completion of the course the student can define the basic concepts and theorems of uni- and multidimensional discrete and continuous probability distributions and can apply this knowledge in other studies in statistics or applied mathematics.

Contents:

Point mass function, density function, cumulative distribution function and quantile function of uni- and multivariate distributions; joint, marginal and conditional distribution; expectation, variance, covariance, correlation coefficient; moment and cumulant generating function; distributions of transformations of random variables and vectors; delta-method; convergence of random variable sequences and limit theorems; main univariate distribution models, multivariate normal distribution, important sampling distributions.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h) and practicals (14 h)

Target group:

Master's students of statistics, applied mathematics and mathematics

Prerequisites and co-requisites:

Introduction to probability theory I and II, vector analysis (or corresponding)

Recommended optional programme components:

Prerequisite for the course Theory of Statistical Inference

Recommended or required reading:

Severini, T. Elements of Distribution Theory, Cambridge University Press, 2012

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Esa Järvenpää

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Learning outcomes:

After passing the course the student recognises fractal phenomena in everyday life and can calculate simple characteristics of fractals.

Contents:

Examples of fractals, iterated function systems, box counting dimension and complex dynamics.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors. Well suited for teacher students and also minor students.

Prerequisites and co-requisites:

Basic studies in mathematics.

Assessment methods and criteria:

Final exam

Grading:

Fail, 1-5

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Meng Wu

Opintokohteen kielet: English

ECTS Credits:

5 ECTS credits

Language of instruction:

English

Learning outcomes:

On successful completion of this course, the student will be able to:

- derive and prove basic results of modern real analysis.
- apply the results and methods of modern real analysis in different topics of mathematics, like in Geometric Measure Theory, Fractal Geometry, Dynamical systems.

Contents:

The course presents Lebesgue spaces (Hölder's and Minkowski's inequalities), the Vitali covering theorem, the Hardy-Littlewood maximal function, Lebesgue's density theorem, Mastrand's projection theorem, rectifiability.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises

Target group:

Students with some background on real analysis.

Assessment methods and criteria:

Exercises and Final Exam

Grading:

Fail, 1-5

Voimassaolo: 01.01.2018 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Pekka Salmi

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish/English

Learning outcomes:

After completing the course the student is able to:

- describe well-known symmetry groups
- determine symmetry groups of geometric objects
- use groups as objects that encode symmetries
- use permutations to represent symmetries
- explain basic concepts associated to group actions
- apply algorithms associated to permutations

Contents:

The notion of group comes from symmetries of different objects such as sets or geometrical objects. In this course we consider groups from this viewpoint. Permutations, i.e. symmetries of sets, give the foundation for these considerations. Then we proceed to study symmetries of more complicated objects such as geometrical ones. Symmetries are closely related to group actions on different objects. We cover the basic notions associated to group actions such as orbits and stabilisers. One important class of symmetry groups is formed by matrix groups and also those are studied. In addition we consider the relations between all these groups.

Mode of delivery:

Face-to-face teaching, computer exercises (in Finnish)

Learning activities and teaching methods:

28 lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors including prospective subject teachers

Prerequisites and co-requisites:

802354A Basics of algebra,
802320A Linear algebra,
802357 Euclidean spaces

Recommended or required reading:

Lecture notes, STACK-exercises

Assessment methods and criteria:

Final exam, exercises

Grading:

1-5, fail

802675S: Introduction to Additive Combinatorics, 5 op

Voimassaolo: 01.08.2019 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Ville Suomala

Opintokohteen kielet: English, Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish (Most of the course material can be provided in English, if necessary).

Timing:

1st period (autumn semester)

Learning outcomes:

Upon completion of the course:

- The student is able to handle basic sumset estimates.
- Is familiar with elementary results related to arithmetic progressions such as the Cauchy-Davenport Theorem and Van der Waerdens Theorem.
- Understands how arithmetic structure is related and nonrelated to the size of the set in various settings.
- Can recognize problems related to additive combinatorics and its applications.

Contents:

Roths theorem on arithmetic progressions, Freiman's theorem, Balogh-Szemerédi-Gowers theorem. Applications of additive combinatorics.

Mode of delivery:

Lectures and exercises

Learning activities and teaching methods:

Lectures 28 h, exercises 8 h, independent study 91 h

Target group:

All math students (major and minor).

Prerequisites and co-requisites:

This is an independent course. Basic knowledge in University mathematics is enough.

Recommended optional programme components:

The course 802673S Additive combinatorics is a continuation of this course.

Assessment methods and criteria:

Exam

Grading:

Failed, 1-5

Person responsible:

Arvostelu: 1 - 5, pass, fail

Opettajat: Ville Suomala

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish or english depending on the participants

Timing:

2nd period (autumn semester)

Learning outcomes:

Upon completion of the course, the students:

- Are familiar with the basic methods of additive combinatorics (sumset estimates, discrete Fourier transform etc.)
- Is familiar with Roths theorem, Freimans Theorem, Balogh-Szemered- Gowers theorem and knows the main ideas in the proofs
- Is able to apply these results

Contents:

Roths theorem on arithmetic progressions, Freiman's theorem, Balogh-Szemerédi-Gowers theorem. Applications of additive combinatorics.

Mode of delivery:

Lectures and exercises

Learning activities and teaching methods:

Lectures 28 h, exercises 8 h, independent study 91 h

Prerequisites and co-requisites:

Introduction to Additive combinatorics or equivalent knowledge

Assessment methods and criteria:

Exam or a seminar presentation

Grading:

Failed, 1-5

Person responsible:

Ville Suomala

802676S: Introduction to Inverse Problems, 5 op

Voimassaolo: 01.08.2019 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Andreas Hauptmann

Opintokohteen kielet: English

ECTS Credits:

5 ECTS credits

Language of instruction:

English

Timing:

3rd/last year during B.Sc. studies, 1st or 2nd year of Master, 3rd period.

Learning outcomes:

After successful completion of the course the student can identify linear ill-posed inverse problems and their severity. Furthermore, the students will be able to analyze and solve such problems with direct and

indirect solution methods, identify necessary regularization, is able to implement such methods and work with basic simulated and experimental data.

Contents:

Theory of ill-posed inverse problems, singular value decomposition, Generalized-Inverse and Normal equations, Landweber iterations and Tikhonov regularization, Morozov discrepancy principle. Examples include convolutions, Fourier and Radon transform, corresponding to applications in image processing, X-ray and Magnetic Resonance Tomography. Use of Matlab/Python for implementation.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h), practical and computer classes (14 h) and independent work.

Target group:

Students having mathematics, applied mathematics, or statistics as the major or a minor subject.

Prerequisites and co-requisites:

Core courses in the B.Sc curriculum of mathematical sciences, especially linear algebra; Numerical Analysis, Fourier analysis (beneficial, but not necessary), Functional analysis (beneficial, but not necessary).

Recommended or required reading:

Mueller, J and Siltanen, S (2012). Linear and nonlinear inverse problems, SIAM.

Assessment methods and criteria:

Active participation in practicals and final exam.

Read more about assessment criteria at the University of Oulu webpage.

Grading:

Fail, 1-5

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Andreas Hauptmann

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credit

Language of instruction:

English

Timing:

4th period, 3rd/last year during B.Sc. studies, 1st or 2nd year of Master

Learning outcomes:

After successful completion of the course the student will be able to efficiently solve inverse problems computationally. Students will be able to identify suitable solution methods and incorporate prior knowledge, understand basics and difficulties of real-life inverse problems. Solutions will be implemented in Matlab/Python using simulated and experimental data.

Contents:

Efficiently deal with large-scale tomographic problems, Formulate and compute solutions with variational methods, First and second order optimization methods, Basics of convex optimization and primal-dual methods, Basics of Bayesian methods and uncertainty quantification, Machine and Deep Learning for Inverse Problems.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (24 h), practical and computer classes (18 h) and independent work.

Target group:

Students having mathematics, applied mathematics, or statistics as the major or a minor subject.

Prerequisites and co-requisites:

Introduction to Inverse Problems, Core courses in the B.Sc curriculum of mathematical sciences, Numerical Analysis, Fourier analysis (recommended), Functional analysis (beneficial, but not necessary).

Recommended or required reading:

Kaipio, J and Somersalo, E (2006), Statistical and computational inverse problems, Springer Science & Business Media.

Vogel, C (2002), Computational methods for inverse problems, SIAM.

Assessment methods and criteria:

Active participation in practicals and final exam.

Language of instruction:

Finnish

Learning outcomes:

After completing the course, the student:

- understands the basic principles and concepts of error correcting codes
- can code and decode using the codes introduced on the course
- knows how to derive and prove the main results introduced on the course

Contents:

The course is about the theory of error correcting codes needed in the transfer of information. The goal of the course is to give students the basic knowledge of the structure and use of these codes. The focus is on binary block codes and the most important subjects are linear codes, RM-codes and cyclic codes. Finally we consider convolutional codes.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures + exercises 30 h, independent studying 105 h

Target group:

Major and minor students

Prerequisites and co-requisites:

802354A Basics in Algebra, 802355A Algebraic structures, 802120P Introduction to Matrices

ECTS Credits:

5 ECTS credits

Language of instruction:

English

Timing:

3rd/last year during B.Sc., 1st or 2nd year of Master

Learning outcomes:

Students will be familiar with basic operations to analyse, process, and understand images. Identify suitable presentations for different classes of images. Learn suitable analytical models for denoising and segmentation of images. We will discuss methods for classifications and decomposition of images and image sequences. Methods will be implemented using Matlab/Python.

Contents:

Basics of representing images and signals using Fourier and wavelet transforms. Variational models for image denoising and nonlinear diffusion. Deconvolution and basic inverse problems arising in imaging. Segmentation and the Mumford-Shah functional. Image classification and low rank decompositions. Motion estimation and optical flow.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h), practical and computer classes (14 h) and independent work.

Target group:

Students having mathematics, applied mathematics, or statistics as the major or a minor subject.

Prerequisites and co-requisites:

Core courses in the B.Sc curriculum of mathematical sciences, Numerical Analysis, optimization (recommended), Introduction to Inverse Problems (beneficial, but not necessary).

Recommended or required reading:

Weickert, Joachim. *Anisotropic diffusion in image processing*. Vol. 1. Stuttgart: Teubner, 1998.

Learning outcomes:

Students will get familiar mathematical concepts underlying deep learning models. Use optimization methods to train large models. Understand the approximation properties of learned models. Get familiar with concepts of probability distributions and optimal transport to train and design generative networks. Accompanying implementations are done in Python.

Contents:

Basic neural network architectures used for computer vision. Optimization techniques used to train large models. Principles of automatic differentiation. Universal approximation theorem. Optimal transport, Wasserstein distances, Sinkhorn approximation, and generative networks.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (24 h), practical and computer classes (18 h) and independent work.

Target group:

Students having mathematics, applied mathematics, or statistics as the major or a minor subject. Theoretical Computer Science.

802665S: Numerical Analysis, 5 op

Voimassaolo: 01.06.2015 -
Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish/English

Timing:

4th or 5th year of studies

Learning outcomes:

On successful completion of this course, the student will be able to choose proper numerical methods for solving basic mathematical problems and approximate the errors of numerical results.

Contents:

The lecture course is focused to numerical methods for solving the most common basic problems in mathematics. For the methods, convergence, stability and suitability for computer arithmetic are considered. The course contains numerical solution methods for the following basic problems: systems of nonlinear equations, systems of linear equations, interpolation, integration, derivation and differential equations.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h and exercises 14 h

Target group:

Major and minor students

Prerequisites and co-requisites:

Bachelor's degree in mathematics or equivalent studies

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Lecture notes Ward Cheney, David Kincaid: Numerical Mathematics and Computing

Assessment methods and criteria:

Final exam

Grading:

Fail, 1-5

Person responsible:

Erkki Laitinen

No

031051S: Numerical Matrix Analysis, 5 op

Voimassaolo: 01.08.2012 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Applied Mathematics and Computational Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Marko Huhtanen

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits / 135 hours of work

Language of instruction:

Finnish or English.

The course can be completed in English by intermediate exams or by a final exam.

Timing:

Fall semester, period 1

Learning outcomes:

After completing the course the student knows the most efficient and numerically stable methods to solve the basic problems in linear algebra. He/she knows the basic matrix factorizations and their approximations. The student has the capability to solve very large and sparse problems with the iterative solutions methods and understands the significance of preconditioning.

Contents:

Theory of matrix decompositions, SVD-decomposition, LU-decomposition, QR-decomposition, Schur-decomposition, FFT, eigenvalue- and generalized eigenvalue problems, matrix functions, GMRES, MINRES, Preconditioning.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h / Group work 14 h / Self-study 93 h.

Target group:

-

Prerequisites and co-requisites:

Completion of courses Calculus I and II, a course on Differential Equations and a Course on Linear Algebra and Numerical analysis

Recommended optional programme components:

-

Recommended or required reading:

Material posted on the web-page of the course.

Assessment methods and criteria:

Intermediate exams or a final exam.

Read more about [assessment criteria](#) at the University of Oulu webpage.

Grading:

The course utilizes a numerical grading scale 1-5. In the numerical scale zero stands for a fail.

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

4th or 5th year of studies

Learning outcomes:

On successful completion of this course, the student will be able to identify the correct methods for solving the linear optimization problems and implement the most typical numerical algorithms for solving linear optimization problems.

Contents:

The lecture course is focused to methods, which can apply for solving essential linear optimization problems of technical and economical sciences. The lectures consist of following topics: Convex sets, Graphical solution of LP problem, dual formulation, simplex algorithm, dual-simplex algorithm. The topics are considered theoretically and also numerical algorithms for problem solution are presented.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h and exercises 14 h

Target group:

Pää- ja sivuaineopiskelijat

806631S Random variables and distributions 10.0 op

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

3rd or 4th year of studies

Learning outcomes:

After successful completion of the course the student can define the basic concepts and theorems of uni- and multidimensional discrete and continuous probability distributions and can apply this knowledge in other studies in statistics or applied mathematics. After successful completion of the course the student can define the basic concepts and theorems of uni- and multidimensional discrete and continuous probability distributions and can apply this knowledge in other studies in statistics or applied mathematics.

Contents:

Point mass function, density function, cumulative distribution function and quantile function of uni- and multivariate distributions; joint, marginal and conditional distribution; expectation, variance, covariance, correlation coefficient; moment and cumulant generating function; distributions of transformations of random variables and vectors; delta-method; convergence of random variable sequences and limit theorems; main univariate distribution models, multivariate normal distribution, important sampling distributions.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h) and practicals (14 h)

Target group:

Master's students of statistics, applied mathematics and mathematics

Prerequisites and co-requisites:

Opettajat: Valeriy Serov

Opintokohteen oppimateriaali:

Colton, David, , 1988

Kress, Rainer, , 1999

Folland, Gerald B. , , 1995

Opintokohteen kielet: Finnish

ECTS Credits:

10 ECTS credits

Language of instruction:

English

Timing:

First and second period.

Learning outcomes:

On successful completion of this course, the student will be able to:

- solve linear and quasi-linear partial differential equations of first order using the method of characteristics
- apply the method of separation of variables to solve initial-boundary value problems for heat, wave and Laplace equations
- verify that a given function is a fundamental solution of a partial differential operator
- use single and double layer potentials to solve boundary value problems for Laplacian

Contents:

Linear and nonlinear equations of the first order, trigonometric Fourier series, Laplace equation in \mathbb{R}^n and in bounded domains, potential theory, Green's function, Heat equation in \mathbb{R}^n and in bounded domains, Wave equation in \mathbb{R}^n and in bounded domains, d'Alembert formula for any dimensions, Fourier method.

Arvostelu: 1 - 5, pass, fail

Opettajat: Andreas Hauptmann

Opintokohteen kielet: English

ECTS Credits:

5 ECTS credits

Language of instruction:

English

Timing:

3rd/last year during B.Sc. studies, 1st or 2nd year of Master, 3rd period.

Learning outcomes:

After successful completion of the course the student can identify linear ill-posed inverse problems and their severity. Furthermore, the students will be able to analyze and solve such problems with direct and indirect solution methods, identify necessary regularization, is able to implement such methods and work with basic simulated and experimental data.

Contents:

Theory of ill-posed inverse problems, singular value decomposition, Generalized-Inverse and Normal equations, Landweber iterations and Tikhonov regularization, Morozov discrepancy principle. Examples include convolutions, Fourier and Radon transform, corresponding to applications in image processing, X-ray and Magnetic Resonance Tomography. Use of Matlab/Python for implementation.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h), practical and computer classes (14 h) and independent work.

Target group:

Students having mathematics, applied mathematics, or statistics as the major or a minor subject.

Prerequisites and co-requisites:

Core courses in the B.Sc curriculum of mathematical sciences, especially linear algebra; Numerical Analysis, Fourier analysis (beneficial, but not necessary), Functional analysis (beneficial, but not necessary).

Recommended or required reading:

Mueller, J and Siltanen, S (2012). Linear and nonlinear inverse problems, SIAM.

Assessment methods and criteria:

Active participation in practicals and final exam.

5 ECTS credits

Language of instruction:

English

Timing:

3rd/last year during B.Sc., 1st or 2nd year of Master

Learning outcomes:

Students will be familiar with basic operations to analyse, process, and understand images. Identify suitable presentations for different classes of images. Learn suitable analytical models for denoising and segmentation of images. We will discuss methods for classifications and decomposition of images and image sequences. Methods will be implemented using Matlab/Python.

Contents:

Basics of representing images and signals using Fourier and wavelet transforms. Variational models for image denoising and nonlinear diffusion. Deconvolution and basic inverse problems arising in imaging. Segmentation and the Mumford-Shah functional. Image classification and low rank decompositions. Motion estimation and optical flow.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h), practical and computer classes (14 h) and independent work.

Target group:

Students having mathematics, applied mathematics, or statistics as the major or a minor subject.

Prerequisites and co-requisites:

Core courses in the B.Sc curriculum of mathematical sciences, Numerical Analysis, optimization (recommended), Introduction to Inverse Problems (beneficial, but not necessary).

Recommended or required reading:

Weickert, Joachim. *Anisotropic diffusion in image processing*. Vol. 1. Stuttgart: Teubner, 1998.

805663S: Experimental design, 5 op

Voimassaolo: 01.08.2017 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Läärä Esa

Opintokohteen kielet: English, Finnish

Leikkaavuudet:

806634S Experimental Design 6.0 op

806353A Experimental design 6.0 op

ECTS Credits:

5 ECTS credits / 133 hours of work

Language of instruction:

Finnish

Timing:

The course is organized in intervals of 2-3 years during the 1st or 2nd period.

Learning outcomes:

After successful completion of the course the student can describe the main statistical principles of comparative experiments, recognize the most important experimental designs and their typical contexts of use, and is able to appropriately analyze and interpret results obtained from studies applying these designs.

Contents:

Principles of experimental design; randomization, replication, blocking; completely randomized and randomized blocks designs; factorial experiments, split-unit and cross-over trials; linear model for continuous response, analysis of variance and covariance; use of R environment in data analysis.

Mode of delivery:

Contact teaching

Learning activities and teaching methods:

Lectures 28 h, practicals 14 h, and independent work. The practicals consist of homework and computer class exercises.

Target group:

Students having statistics as the major or a minor subject.

Prerequisites and co-requisites:

806112P Basic methods of data-analysis or 805305A Introduction to regression and analysis of variance plus preceding courses in statistics -- or corresponding skills otherwise acquired.

Recommended optional programme components:

The course is independent.

Recommended or required reading:

Lecture notes and material distributed during lectures and practicals. Recommended reading: Lawson, J. (2014). Design and Analysis of Experiments with R. Chapman and Hall/CRC.

Assessment methods and criteria:

Practical exercises and final exam. Passing the course requires adequate participation in practical and sufficient activity in homework.

Grading:

Numeric scale from 1 to 5.

805661S: Quantitative genetics, 5 op

Voimassaolo: 01.08.2017 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Mikko Sillanpää

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits / 133 hours of work

Language of instruction:

Finnish

Timing:

Period 1

Learning outcomes:

After successful completion of the course the student can describe some basic principles and models of quantitative genetics and relatedness.

Contents:

quantitative genetics, relatedness coefficients and how to measure it, heritability, how to measure selection, polygenic and one locus model, dominance, epistasis, breeding value, hidden Markov model.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures (28 h), exercises (14 h), and independent practical work, student presentation.

Target group:

Students having statistics (or genetics) as the major or a minor subject.

Prerequisites and co-requisites:

Introduction to statistics

Recommended optional programme components:

-

Recommended or required reading:

Introduction to Quantitative Genetics: Falconer, D.S. & Mackay, T.F.C. Forth Edition. 1996. Prentice Hall.

Assessment methods and criteria:

Final exam, exercises, independent practical work, student presentation

Grading:

Fail, 1-5

521497S-01	Pattern Recognition and Neural Networks, Exam	0.0 op
521497S-02	Pattern Recognition and Neural Networks; Exercise Work	0.0 op
521497S	Pattern Recognition and Neural Networks	5.0 op

ECTS Credits:

5 ECTS credits.

Language of instruction:

English.

Timing:

The course unit is held in the spring semester, during period III. It is recommended to complete the course at the end of studies.

Learning outcomes:

After completing the course, student

1. can design simple optimal classifiers from the basic theory and assess their performance.
2. can explain the Bayesian decision theory and apply it to derive minimum error classifiers and minimum cost classifiers.
3. can apply regression techniques to practical machine learning problems.

Contents:

Introduction. Bayesian decision theory. Parametric and non-parametric classification. Feature extraction. Classifier design and optimization. Example classifiers. Statistical regression methods.

Mode of delivery:

Online teaching, guided laboratory work and independent assignment. The laboratory works are done on an online system (Mathworks Grader). Student can do the lab works remotely or in the lab using the same online system.

The course is implemented as remote education via the Moodle work space <https://moodle oulu.fi/course/view.php?id=5729>

This work space opens to students before the course begins. The student must register to the course in WebOodi in order to participate the course.

Learning activities and teaching methods:

Lectures 16 h, Laboratory work 16 h, and Self-study the rest (Independent task assignment).

Target group:

Students who are interested in machine learning and pattern recognition theory and methods.

Prerequisites and co-requisites:

The mathematic studies of the candidate degree program of computer science and engineering, or equivalent. Programming skills, especially basics of the Matlab.

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Will be informed when the course starts.

Assessment methods and criteria:

Laboratory work is supervised by assistants who also verify that the task assignments are completed properly. The Matworks Grader online system also verifies the completed tasks. The independent task assignment is graded which establishes the grade for the course.

Read more about [assessment criteria](#) at the University of Oulu webpage.

Grading:

The course unit utilizes a numerical grading scale 1-5. In the numerical scale zero stands for a fail. The final grade is established by the independent task assignment.

521283S: Big Data Processing and Applications, 5 op**Voimassaolo:** 01.08.2015 -**Opiskelumuoto:** Advanced Studies**Laji:** Course**Vastuuyksikkö:** Computer Science and Engineering DP**Arvostelu:** 1 - 5, pass, fail**Opettajat:** Lauri Lovén**Opintokohteen kielet:** English**ECTS Credits:**

5 ECTS credits

Language of instruction:

English

Timing:

Period IV. It is recommended that the course is taken on the fourth year Spring.

Learning outcomes:

Upon completion of the course, the student :

1. is able to explain the big data phenomenon, its challenges and opportunities.
2. is able to explain the requirements and common principles for data intensive systems design and implementation, and evaluate the benefits, risks and restrictions of available solutions.
3. can explain the principles of big data management and processing technologies and utilize them on a basic level.

Contents:

General introduction into big data, namely: big data fundatmenals, data storage, batch and stream data processing, data analysis, privacy and security, big data use cases.

Mode of delivery:

Online teaching, exercises and seminars. Independent and group work.

Learning activities and teaching methods:

Lectures, exercises, seminars, independent and group work

Target group:

M.Sc. students (computer science and engineering) and other Students of the University of Oulu

Prerequisites and co-requisites:

The Bachelor level studies of Computer science and engineering study programmes or respective knowledge.

Recommended optional programme components:

Finishing 521290S Distributed Systems, 521497S Pattern recognition and neural networks, and 521286A Computer Systems is beneficial.

Recommended or required reading:

Lecture slides and exercise material will be provided. Each lecture will include the reference list for recommended reading. Instructions to necessary installations will be given.

Assessment methods and criteria:

This course assesses students continuously by the completion of small project work, seminar presentations and short reports on a selected topic (group work). Answering two quizzes during the course is optional and provides additional points for final grade. To pass the course, it is enough to get 50 % of available points. No exam.

Read more about [assessment criteria](#) at the University of Oulu webpage.**Grading:**

The course utilizes a numerical grading scale 1-5. In the numerical scale zero stands for a fail.

Person responsible:

Lauri Lovén

Working life cooperation:

The course includes also invited lectures from industry.

Course is in Moodle.

521156S: Towards Data Mining, 5 op

Voimassaolo: 01.08.2017 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Computer Science and Engineering DP

Arvostelu: 1 - 5, pass, fail

Opettajat: Satu Tamminen

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

English

Timing:

Autumn, period I.

Learning outcomes:

After completing this course, student can recognize data types and perform required pre-processing steps before further analysis:

1. Student can design and implement a data collection process
2. Student can combine data from different sources
3. Student can normalize and transform data, and handle missing or incorrect values
4. Student can ensure generalizability of the results

Contents:

Course provides good ability to start Master's Thesis or graduate studies. Topics at the course include data mining process in general level, data gathering and different data types, quality and reliability of the data, data preparation including the processing of missing values, outliers, and privacy issues, combination of signals from several sources, utilization of data bases in data mining process, and normalization and transformation of data and interdependence of the observations and their distributions. Additionally, topics concerning the generality of the results are covered, as well as, the principles of data division, for example, train-test-validate, cross-validation and leave-one-out methods.

Mode of delivery:

Lectures, independent work, group work

Learning activities and teaching methods:

16 h lectures, 16 h exercises, independent studying.

Target group:

The course is suitable for Master level students in Computer science and engineering study programmes, for minor subject studies or for doctoral students.

Prerequisites and co-requisites:

031021P Probability and Mathematical Statistics or similar

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Lecture hand-out and exercise material will be provided. The course book will be announced in the beginning of the course. The material is mostly in English.

Assessment methods and criteria:

Weekly pre-lecture assignment + exercise submissions, and final exam. Half of the grade will be based on the submissions and half on the final exam.

Towards Data Mining 521156S:3

521158S: Natural Language Processing and Text Mining, 5 op

Voimassaolo: 01.08.2017 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Computer Science and Engineering DP

Arvostelu: 1 - 5, pass, fail

Opettajat: Mourad Oussalah

Opintokohteen kielet: English

ECTS Credits:

5 ECTS credits / 120 hours of works

Language of instruction:

English

Timing:

Period 1. It is recommended to complete the course at the end of period 1

Learning outcomes:

Upon completing the course, the student is expected to i) comprehend, design and implement basic (online) text retrieval and query systems; ii) account for linguistic aspects and perform word sense disambiguation; iii) perform basic (statistical) inferences using corpus; iv) manipulate (statistical) language modelling toolkits, online lexical databases and various natural language processing tools.

Contents:

Foundation of text retrieval systems, Lexical ontologies, word sense disambiguation, Text categorization, Corpus-based inferences and Natural Language Processing tools

Mode of delivery:

Face- to-face teaching and laboratory sessions

Learning activities and teaching methods:

Lectures (24 h), tutorial/laboratory sessions (16h), seminar (6h) and practical work. The course is passed with an approved practical work and class test. The implementation is fully in English.

Target group:

students with (moderate to advanced) programming skills in Python

Prerequisites and co-requisites:

Programming skills (preferably) in Python

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time

Recommended or required reading:

Introduction to Information Retrieval, by C. Manning, P. Raghavan, and H. Schütze. Cambridge University Press, 2008. (Free from <http://nlp.stanford.edu/IR-book/>) Foundations of statistical natural language processing, by Manning, Christopher D., Schütze, Hinrich. Cambridge, Mass.: MIT Press, 2000

Assessment methods and criteria:

One class test (30%) in the middle of the term + Project work (70%)

521266S	Distributed Systems	6.0 op

ECTS Credits:

5 ECTS cr

Language of instruction:

In English.

Timing:

Spring, period 3.

Learning outcomes:

After completing the course, the student

1. is able to explain the key principles of distributed systems
2. apply the principles in evaluating major design paradigms used in implementing distributed systems
3. solve distributed systems related problems
4. design and implement a small distributed system

Contents:

Introduction, architectures, processes, communication, naming, synchronization, consistency and replication, fault tolerance, security, case studies.

Mode of delivery:

Online teaching

Learning activities and teaching methods:

Lectures 22 h, exercises 16 h, project work 50 h, self-study 47 h.

Target group:

M.Sc. students (computer science and engineering) and other Students of the University of Oulu

Prerequisites and co-requisites:

None.

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Required literature: Maarten van Steen and Andrew S. Tanenbaum, Distributed Systems – Principles and Paradigms, Third Edition, 2017.

Assessment methods and criteria:

The course uses continuous assessment so that there are 2 intermediate exams. Alternatively, the course can also be passed with a final exam. The course includes a mandatory project work.

20 ECTS credits

Language of instruction:

Finnish (or English)

Timing:

5. year of studies

Learning outcomes:

After writing the Master's degree, student has written an analytical and logical study of a problem or theory in a field of mathematics, applied mathematics or statistics. Completing the thesis successfully, student is able to write scientific articles and texts in mathematics.

Contents:

The scope of the Master's thesis is 20 cr for Teacher students and 30 cr in other disciplines. In Master's thesis, the student engages in researching a specific mathematical area or problem in the field of mathematics, applied mathematics or statistics.

Mode of delivery:

Thesis

Learning activities and teaching methods:

Own work, meetings with the supervisor

Target group:

Major students

Prerequisites and co-requisites:

Bachelor's degree (or equivalent)

ECTS Credits:

5 ECTS credits / 133 hours of work

Language of instruction:

Finnish

Timing:

4th year, 3rd and 4th period

Learning outcomes:

After completing the course the student is able to:

- combine a mathematical way of thinking to teaching
- plan teaching content that supports mathematical understanding
- use studies in didactics of mathematics in their teaching
- find and interpret articles in didactics of mathematics.

Contents:

In this course the students plan and execute teaching samples. In addition we examine research in didactics of mathematics. The students also report about their works. Works are discussed in a seminar.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h seminar, 105 h group work and independent studies

Target group:

Mathematics subject teacher students

Prerequisites and co-requisites:

5 ECTS credits

Language of instruction:

Finnish

Timing:

Second year, 1. period

Learning outcomes:

After completing the course, student is able to:

- derive and proof main results in the course
- use and apply different proof techniques
- recognize algebraic structures and the concepts
- see connections and differences between different algebraic structures

Contents:

The course introduces algebraic structures, such as rings, subrings, ideals, integral domains, fields and finite fields. The course gives an understanding of algebraic terms and concepts used in mathematics and physics.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish/English

Timing:

1. period

Learning outcomes:

We start our lectures by considering b-base expansions and simple continued fraction expansions of real numbers. The properties of these expansions like -terminating, non-terminating, irrationality, periodicity, approximation properties will be studied.

Next we investigate general continued fractions with corresponding recurrences and transformations. A particular attention is paid for convergence and irrationality criteria.

Further, expansions of hypergeometric series are presented which imply expansions to well-known Napier's constant and pi.

The research will be directed to more general irrationality questions and Diophantine equations, too.

Learning outcomes:

On successful completion of this course, the student will be able to identify the correct methods for solving the linear optimization problems and implement the most typical numerical algorithms for solving linear optimization problems.

Contents:

The lecture course is focused to methods, which can apply for solving essential linear optimization problems of technical and economical sciences. The lectures consist of following topics: Convex sets, Graphical solution of LP problem, dual formulation, simplex algorithm, dual-simplex algorithm. The topics are considered theoretically and also numerical algorithms for problem solution are presented.

802667S: Nonlinear Optimization, 5 op

Voimassaolo: 01.06.2015 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

4th or 5th year of studies

Learning outcomes:

On successful completion of this course, the student will be able to choose the correct methods for solving the nonlinear convex optimization problems and implement the most typical numerical algorithms for solving them.

Contents:

The lecture course is focused to methods, which can apply for solving essential optimization problems of technical and economical sciences. The lectures consist of following topics: Convex optimization problem, unconstrained convex optimization, constrained convex optimization, dual of convex problem, Karush-Kuhn-Tucker conditions and penalty optimization method. The topics are considered theoretically and also numerical algorithms for problem solution are presented.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h and exercises 14 h

Target group:

Major and minor students

Prerequisites and co-requisites:

Bachelor degree in mathematics or equivalent

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Lecture notes.

801698S: Cryptography, 5 op

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen oppimateriaali:

Trappe, Wade; Washington, Lawrence C., , 2005

Menezes, Alfred J.; van Oorschot, Paul C.; Vanstone, Scott A., , 1997

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish (in exercises also English)

Learning outcomes:

After passing the course the student is able to use:

- primality testing
- algorithms for solving discrete logarithm
- elliptic curves on cryptography
- lattices on cryptography
- digital signatures

Contents:

Primality testing, Pollard's $p-1$ factorization method, Shanks's Babystep-Giantstep algorithm, The index calculus method for computing discrete logarithms, Pollard rho method, The Pohlig-Hellman algorithm, Elliptic curves and cryptography (Diffie-Hellman, ElGamal, Menezes-Vanstone, Lenstra), Lattices and cryptography (GGH, NTRU, LLL), Digital signatures.

Learning activities and teaching methods:

28 h lectures, 14 h exercises

Target group:

Major and minor students

Prerequisites and co-requisites:

Basic in Algebra
 Algebraic structures
 Introduction to Cryptography

Recommended or required reading:

Lecture notes;
 Hoffstein, Jeffrey, Pipher, Jill, Silverman, Joseph H.: An introduction to mathematical cryptography.

Assessment methods and criteria:

800694S: Introduction to Fractal Geometry, 5 op

Voimassaolo: 01.01.2018 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Esa Järvenpää

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Learning outcomes:

After passing the course the student recognises fractal phenomena in everyday life and can calculate simple characteristics of fractals.

Contents:

Examples of fractals, iterated function systems, box counting dimension and complex dynamics.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors. Well suited for teacher students and also minor students.

Prerequisites and co-requisites:

Basic studies in mathematics.

Assessment methods and criteria:

Final exam

Grading:

Fail, 1-5

Person responsible:

Esa Järvenpää

802642S: Symmetry groups, 5 op

Voimassaolo: 01.01.2018 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Pekka Salmi

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish/English

Learning outcomes:

After completing the course the student is able to:

- describe well-known symmetry groups
- determine symmetry groups of geometric objects
- use groups as objects that encode symmetries
- use permutations to represent symmetries
- explain basic concepts associated to group actions
- apply algorithms associated to permutations

Contents:

The notion of group comes from symmetries of different objects such as sets or geometrical objects. In this course we consider groups from this viewpoint. Permutations, i.e. symmetries of sets, give the foundation for these considerations. Then we proceed to study symmetries of more complicated objects such as geometrical ones. Symmetries are closely related to group actions on different objects. We cover the basic notions associated to group actions such as orbits and stabilisers. One important class of symmetry groups is formed by matrix groups and also those are studied. In addition we consider the relations between all these groups.

Mode of delivery:

Face-to-face teaching, computer exercises (in Finnish)

Learning activities and teaching methods:

28 lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors including prospective subject teachers

Prerequisites and co-requisites:

802354A Basics of algebra,

802320A Linear algebra,

802357 Euclidean spaces

Recommended or required reading:

Lecture notes, STACK-exercises

Assessment methods and criteria:

Final exam, exercises

Grading:

Person responsible:

Pekka Salmi

802675S: Introduction to Additive Combinatorics, 5 op

Voimassaolo: 01.08.2019 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Ville Suomala

Opintokohteen kielet: English, Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish (Most of the course material can be provided in English, if necessary).

Timing:

1st period (autumn semester)

Learning outcomes:

Upon completion of the course:

- The student is able to handle basic sumset estimates.
- Is familiar with elementary results related to arithmetic progressions such as the Cauchy-Davenport Theorem and Van der Waerden's Theorem.
- Understands how arithmetic structure is related and nonrelated to the size of the set in various settings.
- Can recognize problems related to additive combinatorics and its applications.

Contents:

Roth's theorem on arithmetic progressions, Freiman's theorem, Balogh-Szemerédi-Gowers theorem. Applications of additive combinatorics.

Mode of delivery:

Lectures and exercises

Learning activities and teaching methods:

Lectures 28 h, exercises 8 h, independent study 91 h

Target group:

All math students (major and minor).

Prerequisites and co-requisites:

This is an independent course. Basic knowledge in University mathematics is enough.

Recommended optional programme components:

The course 802673S Additive combinatorics is a continuation of this course.

Assessment methods and criteria:

Exam

Grading:

Failed, 1-5

Person responsible:

Ville Suomala

802656S: Algebraic numbers, 5 op

Voimassaolo: 01.01.2012 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish and English

Timing:

3/4 year, 4th period

Learning outcomes:

As usual in my mathematical studies I shall be able to solve problems arising from the subject and to prove essential theorems starting from the given definitions using the tools applied in the course. More detailed; For example, when I pass the course with the grade 1/5, I shall recognize most definitions and I am able to solve closely related problems. Also I am able to rewrite short proofs with some understanding. When I pass the course with the grade 5/5, then I shall understand well the given definitions with the proofs of the theorems deduced from them. Further, I am able to solve challenging problems which demand independent deductions with several stages and applications of appropriate tools.

Contents:

First we revise some basics of rings and fields which are needed to proceed ahead field extensions. In particular, divisibility in an integral domain is carefully studied yielding to applications in the theory of polynomial algebra and algebraic integers. The theory of algebraic numbers is strongly based on polynomial algebra, where the properties of zeros and divisibility of polynomials are considered. The definition of an algebraic number will be generalized to the algebraic elements of field extensions going forward to algebraic fields. Considered as most important algebraic fields we get number fields which are finitely generated subfields of the field \mathbb{C} of all complex algebraic numbers. In particular, we study quadratic number fields. Further, we shall consider the divisibility and factorization of algebraic integers with some applications to Diophantine equations.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors

Prerequisites and co-requisites:

Basics in Algebra, Algebraic structures, Matrix algebra, Linear algebra, Basics in Number Theory

Recommended or required reading:

I.N. Stewart and D.O. Tall: Algebraic number theory, Mollin, Richard A., Advanced number theory with applications,

801389A Basic Geometry for University Students 6.0 op

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

2nd to 5th year

Learning outcomes:

After completion of the course, the student can use geometric axioms to justify simple geometric results and apply axioms and known results in geometric problems and deductions.

Contents:

The course is an introduction to axiomatic geometry from a modern viewpoint. Using geometric axioms, we first derive the concept of vector and vectors are used in the study of geometry.

We first study affine geometry and then Euclidean geometry. Some classical results such as Ceva's theorem are derived. Finally, we consider area and volume.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 hours lectures, 14 hours tutorials, 91 hours independent work

Target group:

Major and minor students in mathematics

Prerequisites and co-requisites:

Linear algebra

Recommended or required reading:

Lecture notes. Literature: John Roe, Elementary Geometry, Oxford University Press, Oxford, 1993.

Assessment methods and criteria:

Final exam

Grading:

ay802336A	Introduction to Cryptography (OPEN UNI)	5.0 op
801346A	Introduction to Cryptography	4.0 op

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

2nd year or later, every period and twice in the summer

Learning outcomes:

After completing the course, student:

- knows the principles of some traditional symmetric key methods
- knows how public key methods (RSA, discrete logarithm, knapsack) work
- is familiar with the possibility to use and apply number theory in cryptography

Contents:

The course considers some traditional symmetric key methods (affine system, matrix cryptography) and three public key methods, namely RSA, discrete logarithm and knapsack.

Mode of delivery:

Independent work

Learning activities and teaching methods:

Net course; Lecture slides, exercises, solutions of exercises (in Moodle) + stack-exercises

Target group:

Major and minor students

Prerequisites and co-requisites:

802354A Basics of Algebra, 802120P Introduction to Matrices

Recommended optional programme components:

802365A: Introduction to Mathematical Software, 5 op

Voimassaolo: 01.06.2015 -

Opiskelumuoto: Intermediate Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish (also English if needed)

Timing:

2.-3. year

Learning outcomes:

Upon completion of the course, the student knows the basics of the use of the most common mathematical software, is able to use mathematical software in solving mathematical tasks and problems, and is able to independently deepen her knowledge of different mathematical software as necessary.

Contents:

During the course, the student learns the basics of some of commonly used mathematical software which include Matlab and Python (Numpy/Scipy).

Mode of delivery:

The course is arranged in a computer class as a series of lectures and rehearsals. On the lectures, the students have the possibility to use and try the mathematical software during the lectures. In the rehearsals, different given problems and tasks are solved together.

Learning activities and teaching methods:

Lectures 22 h / Rehearsals 22 h / Self-study 60 h. The self-study contains the independent learning of the software and also the preparation of the final assignments.

Target group:

Anybody interested in mathematical software.

Prerequisites and co-requisites:

The required prerequisite is the completion of following courses (or corresponding knowledge of the subject):

- 802120P Matrix calculus
- 802320A Linear algebra

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

The required and recommended reading consists mainly on free material (manuals/tutorial) found in the internet. More information will be given at the beginning of the course.

Assessment methods and criteria:

The course is assessed by final assignments. The student who wish to complete the course at A-level will make two separate assignments of given topics using (at least) two different mathematical software. Those who wish to complete the course in S-level will need to discuss with the lecturer about the extra work needed to pass. For example, it could be possible to do assignments of wider topics, making an assignment (s) with a software not covered in the course, or making an assignment that requires particular skills and knowledge.

Grading:

The course utilizes grading scale pass / fail.

Further, I am able to solve challenging problems which demand independent deductions with several stages and applications of appropriate tools.

Contents:

In our lectures we consider arithmetical properties of the common numbers involved in studying mathematics and in particular number theory. Also the methods will get a special interest. Examples of the numbers under the research will be binomials, continued fractions, sums of powers and some numbers sharing a name with the mathematicians Bernoulli, Euler, Fermat, Fibonacci, Heron, Lucas, Mersenne, Neper, Pythagoras, Stirling, Wilson and Wolstenholme. From the tools we mention congruences of rational numbers and polynomials, difference operators, generating series, irrationality considerations, matrix presentations, recurrences and telescopes.

ECTS Credits:

5 ECTS credits / 133 hours of work

Language of instruction:

Finnish

Timing:

2nd year

Learning outcomes:

Upon completing the course the student:

- is able to classify differential equations and is able to apply correct solution methods to them
- knows the conditions that guarantee the unique solvability of an equation
- understands the concept of implicitly defined solution

Contents:

The course is devoted to ordinary differential equations. Central part is formed by first order differential equations (separable, homogeneous, linear, exact equations and certain equations which can be transformed into these). The equations are solved using algebraic, iterative and numerical methods. The second part which is central to applications is formed by linear inhomogeneous differential equations with constant coefficients and linear second order equations with continuous coefficient functions. In addition, systems of differential equations are considered. Certain second order linear differential equations (e.g. Legendre's equation) is solved via power series.

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Timing:

2nd year or later, 3rd period

Learning outcomes:

On successful completion of this course, the student will be able to:

- apply method of Frobenius to solve second order linear differential equations
- derive and prove the basic properties of Bessel functions, Legendre polynomials and Hermite polynomials
- apply integral transformations to solve some integral equations and ordinary differential equations with constant coefficients
- recognize heat and wave equations and choose the proper method to solve them.

Contents:

The course is devoted to second order ordinary differential equations that are important in applications and classical partial differential equations such as heat and wave equations. Method of Frobenius is introduced to solve second order ordinary differential equations. Some special functions (Gamma function and Bessel functions etc.) and also orthogonal polynomials (Legendre and Hermite polynomials) are considered. Basic facts about Fourier series and Fourier transform are given. Laplace transform is discussed at more advanced level than in earlier studies. Separation of variables is introduced as a method to solve certain boundary value problems for heat and wave equations.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h, exercises 14 h

Opettajat: Marko Huhtanen

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits / 135 hours of work

Language of instruction:

Finnish. English speaking students should contact the instructor.
The course can be completed in English by intermediate exams or by a final exam.

Timing:

Spring semester, period 3

Learning outcomes:

Knows numerical algorithms for solving basic problems in computing. Knows basics about numerical linear algebra and some of its applications. Knows how nonlinear systems are solved and how they appear in optimization. Knows how differential equations are solved numerically.

Contents:

Numerical linear algebra, numerical methods for systems of equations, unconstrained optimization, basics of the approximation theory, numerical quadratures, numerical methods for ordinary differential equations.

Mode of delivery:

Online teaching

Learning activities and teaching methods:

Lectures 28 h / Group work 22 h / Self-study 85 h.

Target group:

-

Prerequisites and co-requisites:

Completion of courses Calculus I and II, a course on Differential Equations and a Course on Linear Algebra.

Recommended optional programme components:

-

Recommended or required reading:

Material posted on the web-page of the course.

Assessment methods and criteria:

Intermediate exams or a final exam. The exams are remote exams. It is possible to take exams also at the university.

Read more about [assessment criteria](#) at the University of Oulu webpage.

Grading:

The course utilizes a numerical grading scale 1-5. In the numerical scale zero stands for a fail.

Opintokohteen kielet: Finnish

Leikkaavuudet:

031050A Signal Analysis 4.0 op

ECTS Credits:

5 ECTS credits / 135 hours of work

Language of instruction:

Finnish.

The course can be completed in English by a final exam.

Timing:

The course is held in the autumn semester, during period II. It is recommended to complete the course at the 2nd autumn semester.

Learning outcomes:

Upon completion of the course, the student:

- is able to calculate the energy, the power, the convolution and the frequency spectrum of discrete and analog, periodic and non-periodic deterministic signals
- is able to study the effect of sampling on the signal
- is able to calculate the Hilbert transform and the complex envelope of a signal
- is able to study the stationarity, the mutual dependence and the frequency content of random signals by means of the auto- and cross-correlation functions, and the power- and cross-power spectral densities
- is able to study the effect of an LTI system on a signal

Contents:

Signals, classification, frequency. Fourier analysis, analog and digital signal, fast Fourier transform. LTI system. Hilbert transform. AM- FM- and PM-modulation. Random variable. Covariance matrix. Random signal. Stationarity, autocorrelation. Power spectral density. Random signal in LTI system. Signal estimation.

Mode of delivery:

The lectures and exercise classes will be arranged as distance learning via Zoom. The Zoom-links, directions and other material (in Finnish) will be made available in the Moodle-workspace for the course, which can be found at <https://moodle oulu.fi/course/view.php?id=5361>

Learning activities and teaching methods:

Lectures 28 h / Exercises 14 h / Self-study privately or in a group 93 h. The independent work includes individual STACK-assignments as online work.

Target group:

-

Prerequisites and co-requisites:

The recommended prerequisite is the completion of the courses 031078P Matrix Algebra, 031021P Probability and Mathematical Statistics and 031077P Complex Analysis.

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time.

Recommended or required reading:

Lecture notes. Additional reading: Proakis, J.G., Manolakis, D.K.: Introduction to Digital Signal Processing. Shanmugan, K.S., Breipohl, A.M.: Random Signals, Detection, Estimation and Data Analysis.

Assessment methods and criteria:

The course is completed with mid-term exams or a final exam. When completed with mid-term exams, exercise assignments are part of the continuous assessment. The assessment of the course is based on the learning outcomes of the course.

Grading:

The course utilizes a numerical grading scale 1-5. In the numerical scale zero stands for a fail.

Person responsible:

Vesa Kotila

031077P: Complex analysis, 5 op

Voimassaolo: 01.08.2015 -

Opiskelumuoto: Basic Studies

Laji: Course

Vastuuyksikkö: Applied Mathematics and Computational Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Jukka Kemppainen

Opintokohteen kielet: Finnish

Leikkaavuudet:

ay031077P Complex analysis (OPEN UNI) 5.0 op

031018P Complex Analysis 4.0 op

ECTS Credits:

5 ECTS credits / 135 hours of work

Language of instruction:

Finnish

Timing:

Fall semester, period 1.

Learning outcomes:

After completing the course the student

1. is able to calculate the derivative and the integral of functions of complex variable,
2. understands the concept of analyticity
3. is capable of calculating the contour integrals and using the theory of residues for computing the line integrals, will be able to apply the techniques of complex analysis to simple problems in signal processing.

Contents:

Complex numbers and functions, complex derivative and analyticity, complex series, Cauchy's integral theorem, Laurent and Taylor expansions, theory of residues, applications to signal analysis.

Mode of delivery:

Face-toface teaching, Stack(web-based too) exercises.

Learning activities and teaching methods:

Lectures 28 h/Exercises 14 h/Self study 93 h.

Target group:

The students in the engineering sciences. The other students are welcome, too.

Prerequisites and co-requisites:

The recommended prerequisite is the completion of the courses Calculus I and II, Differential Equations.

Recommended optional programme components:

The course is an independent entity and does not require additional studies carried out at the same time

Recommended or required reading:

The lecture notes

Assessment methods and criteria:

Intermediate exams or a final exam.

Read more about [assessment criteria](#) at the University of Oulu webpage.

Grading:

The course utilizes a numerical grading scale 0-5. In the numerical scale zero stands for a fail.

Person responsible:

Jukka Kemppainen

Working life cooperation:

802338A: Complex Analysis II, 5 op

Voimassaolo: 01.06.2016 -

Opiskelumuoto: Intermediate Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: English

ECTS Credits:

5 ECTS credits / 42 hours of work

Language of instruction:

English

Timing:

The course is held in the autumn semester, during the period 1. It is recommended to complete the course at the first autumn semester.

Learning outcomes:

Upon completion of the course, the student will be able to:

1. Apply the fundamental theorem of integration in complex sense to some concrete functions.
2. Represent functions via power series (for analytic functions) via Laurent expansions (for functions with singularities).
3. Calculate the residues and some classes of integrals using residue theory.
4. Calculate some classes of series by residue theory.
5. Use Laplace transform for solutions of ODEs.

Contents:

1. Fundamental theorem of integration.
2. Harmonic functions and mean value formulae.
3. Liouville's theorem and fundamental theorem of algebra.
4. Representation of analytic functions via the power series.
5. Laurent expansions.
6. Residues and their calculus.
7. The principle of the argument and Rouché's theorem.
8. Calculations of integrals by residue theory.
9. Calculation of series by residue theory.
10. Laplace transform.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures 28 h / Group work 14 h / Self-study at least 20 h.

Target group:

No specific targets except passing final exam w.r.t. the content and outcomes (see previous parts).

Prerequisites and co-requisites:

Complex Analysis (031077P)

Calculus of several variables including multidimensional integral (Calculus of several variables 800328A)

Recommended or required reading:

Any book in Complex Analysis, in particular Lecture Notes of V.S. Serov "Complex Analysis, Second Edition", Oulu University Press, 2017.

Assessment methods and criteria:

Final Exam

Grading:

The course utilizes a numerical grading scale 0-5, zero stands for a fail.

Person responsible:

Valery Serov

Working life cooperation:

The course does not contain working life cooperation.

801396A: Introduction to Probability Theory II, 5 op**Opiskelumuoto:** Intermediate Studies**Laji:** Course**Vastuuyksikkö:** Field of Mathematics**Arvostelu:** 1 - 5, pass, fail**Opintokohteen oppimateriaali:****Tuominen, P.**, , 1993**Opintokohteen kielet:** Finnish**ECTS Credits:**

5 ECTS credits

Language of instruction:

Finnish

Timing:

2nd or 3rd year

Learning outcomes:

After completion of the course, the student:

- can work with random variables in theory and practice
- can use two-dimensional discrete and continuous distributions in problems
- can recognize two-dimensional normal distribution and work with those
- can work with conditional distributions and conditional expectations
- can explain the fundamental results of probability such as the Law of Large Numbers and the Central Limit Theorem
- can determine moment generating functions of random variables and apply them for example to determine moments.

Contents:

Central topics are two-dimensional discrete and continuous distributions, conditional distribution, conditional expectation, two-dimensional normal distribution, moments, moment generating function, the Law of Large Numbers, the Central Limit Theorem.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h of lectures, 14 h of exercises, 91 h of independent study

Target group:

Mathematics major and minor students. Recommended for students aiming for the profile of computational mathematics and data science.

Prerequisites and co-requisites:

801195P Introduction to probability I, 800328A Calculus of several variables (or Vector Calculus)

Recommended or required reading:

P. Tuominen: Todennäköisyyslaskenta I, Limes 2002 and other books on probability.

Assessment methods and criteria:

Final exam

801623S: Introduction to Coding Theory, 5 op

Voimassaolo: 01.01.2018 -

Opiskelumuoto: Advanced Studies

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits

Language of instruction:

Finnish

Learning outcomes:

After completing the course, the student:

- understands the basic principles and concepts of error correcting codes
- can code and decode using the codes introduced on the course
- knows how to derive and prove the main results introduced on the course

Contents:

The course is about the theory of error correcting codes needed in the transfer of information. The goal of the course is to give students the basic knowledge of the structure and use of these codes. The focus is on binary block codes and the most important subjects are linear codes, RM-codes and cyclic codes. Finally we consider convolutional codes.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

Lectures + exercises 30 h, independent studying 105 h

Target group:

Major and minor students

Prerequisites and co-requisites:

802354A Basics in Algebra, 802355A Algebraic structures, 802120P Introduction to Matrices

Assessment methods and criteria:

Final exam

Grading:

1-5, fail

Laji: Course

Vastuuyksikkö: Field of Mathematics

Arvostelu: 1 - 5, pass, fail

Opettajat: Mahmoud Filali

Opintokohteen kielet: Finnish

ECTS Credits:

5 ECTS credits / 133 hours of work

Language of instruction:

Finnish

Timing:

2nd year

Learning outcomes:

Upon completing the course the student is:

- able to manipulate series and investigate their convergence
- able to explain the difference between uniform and pointwise convergence
- able to study the uniform and pointwise convergence of function sequences and series
- able to use power series in approximation

Contents:

The course concerns both number series and function series. The central topics are convergence tests, pointwise and uniform convergence, power series and the Taylor series. The course gives also an introduction to approximation of functions by polynomials for example.

Mode of delivery:

Face-to-face teaching

Learning activities and teaching methods:

28 h lectures, 14 h exercises, 91 h independent study

Target group:

Mathematics majors

Prerequisites and co-requisites:

Leikkaavuudet:

800104P Number Systems 4.0 op

ECTS Credits:

5 ECTS credits

Language of instruction:

finnish

Learning outcomes:

After completing the course, a student knows how to

- define and construct the basic number systems
- define and use the basic arithmetic operations in these number systems and prove some basic results regarding them
- define the cardinality of sets and prove that certain sets have the same cardinality

Contents:

The course is about the basics of the arithmetic and algebra of number systems. In the beginning of the course, knowledge about relations and algebra is revised and deepened. The sets of natural numbers, integers, rational numbers and real numbers are defined as well as their arithmetic and order. Finally the concept of cardinality is introduced.

Mode of delivery:

Face-to-face and online teaching

Learning activities and teaching methods:

Lectures and exercises 30 h, independent study 105 h

Target group:

Major and minor mathematics students

Prerequisites and co-requisites:

802151P Introduction to mathematical deduction, 802354A Basics in algebra

Recommended or required reading:

Moodle

Assessment methods and criteria:

Exercises during the course and final exam
